

How to measure for a Suntech Door

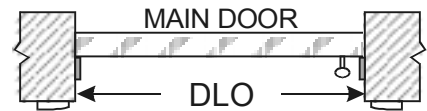

Fig.1

Measuring: Determine where on your entryway framing you are going to install door. Check for clearance of the door handle on main entry door, outside light, roof overhang etc.

Fill in the measurements on Fig.1 & bring back to Lowes Store

Fig.2

Day Light Opening: Fig.2

Width take (3) three measurements top, center & bottom. If different use smallest measurement.

Height take (2) two measurements on the left & right sides use smallest measurement.

Hinge Side: Fig.3 If you are ordering a door with a figurine on the grille (they are made left or right.), or a security lock, or upgrading to a security lock then we need to know the hinge side. To determine the hinge side stand in front of your doorway then decide which way the door has to swing. (Handle on right = hinge left etc.)

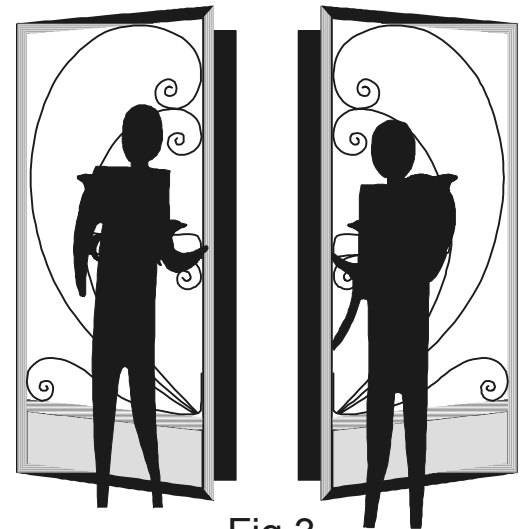

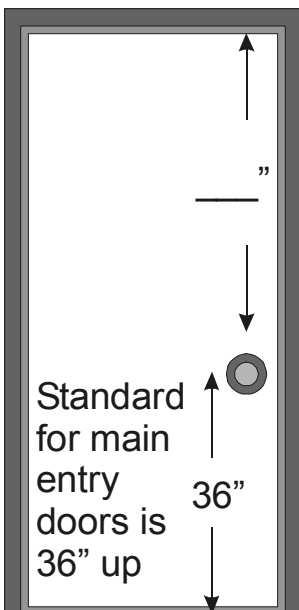

Fig.3

Fig.4

Lock position: Fig.4 If you are ordering a door with a security lock or upgrading to a security lock, besides the hinge side we also need the lock position. (Standard is 40" down from the top to the center of the handle.) Check to see if this will interfere with main door lock by measuring down from the top of door. If it does interfere then determine where you need to position your lock. (If installing on or around a swimming pool check local codes 54" up in Florida.)
